## MEG Experiment: Future Plan

Abstract: The MEG experiment is a new experiment to look for the lepton flavor violating process,  $\mu \rightarrow e \gamma$  down to  $10^{-13}$  branching ratio. The experiment is powerful enough to explore new physics beyond the standard model. We would, however, suffer background if the experiment would run with the highest intensity muon beam available at PSI. An upgrade of the experiment is certainly necessary for the maximal use of the PSI beam. Possible upgrade strategies for the MEG experiment will be discussed here.
